

The company needs to move data from on-premise to cloud systems but lacks the necessary knowledge and infrastructure.

The data must be replicated in the cloud while minimizing costs.

Why use Adoki?

Custom type mappings

- Automatically generate cloud object schemas based on the on-premise object schemas.
- Adjust schema generation for select cases.

Incremental loads

- Replicate only the required data subsets and have them incremented automatically.

Simple transformations

- Take only a subset of data and transform/anonymize them before they are saved to the cloud. Save data efficiently.

Resource manager

- Control how many resources are spent on the cloud.
